

Business Process Control Center for SAP Analytics Cloud

Start and monitor processes and activities across multiple SAP BW/4HANA and SAP S/4HANA systems from one business-friendly control center.

Why it matters

Business users often need to trigger jobs, process chains, reports, events, or parameter updates in different SAP systems. Normally this requires deep technical knowledge, separate transactions, and switching between systems.

This solution brings those distributed activities into SAP Analytics Cloud through a guided story interface with live process visibility, clear status, and controlled execution using the authorizations of the SAP user.

What users see

- Live process and activity catalog based on BW query and hierarchy
- Status, target system, last execution date and time, and description
- Optional text input and drop-down parameters before execution
- One-click execution and status refresh from SAP Analytics Cloud
- Central business-facing interface for distributed SAP operations

Key benefits

Less technical complexity

Users work in SAP Analytics Cloud instead of jumping between transactions and systems.

Better process visibility

Statuses, systems, descriptions, and execution timestamps are visible in one consistent UI.

Controlled execution

Execution remains inside the relevant SAP system and respects user authorizations.

How it works

1

Select the required process or activity

Business users choose the relevant entry from one central view and review status, description, and target system.

2

Provide optional parameters and execute

If required, users enter values or choose options before triggering the action directly from SAP Analytics Cloud.

3

Monitor execution status

Users refresh the story to see the latest execution date, time, status, and target system information.
